Hello all,

I have the gentoo template running on a virtuozzo server..
Only I have the following problem, every time I want to boot my
virtual machine it goes to init 0..
the init gets it's commands from inittab, but I don't know exactly if
that should be adapted for a virtual machine..

regards

Try adapting RC_PARALLEL_STARTUP="no" in /etc/conf.d/rc. This makes
sometimes problems ;)

It was already set to 'no'..
setting it to 'yes' didn't make any difference

1. This is not Virtuozzo support. If you are Virtuozzo customer, ask
their support. If you are hosting customer -- ask you HSP support.

2. Steps of modifying a new Gentoo installation to adopt it to OpenVZ
are described at http://wiki.openvz.org/Gentoo_template_creation
(starting from the item #5). I can not guarantee they are applicable to
Virtuozzo.

Hello Kir,
I am not the owner of the host system :)
I had debian succesfully installed using debootstrap..
the idea is to do the same with gentoo..

This is part of a dutch project to test out virtual servers from
Strato, germany.

I made a little bash script which puts the output of 'ps -ax' in
/root/firstboot..
This has the following content:
---
```
USER       PID %CPU %MEM    VSZ   RSS TTY      STAT START   TIME COMMAND
root         1  0.0  0.0   1396   488 ?        Ss   16:31   0:00 init
root      3497  4.6  0.0   2384  1396 ?        Ss   16:40   0:00
/bin/bash /sbin/rc shutdown
root      4423  0.0  0.0   2524  1428 ?        S    16:40   0:00
/bin/bash /sbin/rc shutdown
root      4431  0.0  0.0   2032   852 ?        R    16:40   0:00 ps -aux
USER       PID %CPU %MEM    VSZ   RSS TTY      STAT START   TIME COMMAND
root         1  0.0  0.0   1396   488 ?        Ss   16:31   0:00 init
root      3497  4.6  0.0   2384  1396 ?        Ss   16:40   0:00
/bin/bash /sbin/rc shutdown
root      4423  0.0  0.0   2524  1428 ?        S    16:40   0:00
/bin/bash /sbin/rc shutdown
root      4433  0.0  0.0   2032   852 ?        R    16:40   0:00 ps -aux
```
--

Just to give you an idea :)
I would like to know why and where shutdown gets initiated.. so I can
stop it and let the VPS boot normal..

Tonko

Hi Tonko,

I'd guess this comes from your HSP (Strato).
Reason is probably quite simple if you knew how VZ/OpenVZ works.

If I am not mistaking (O)VZ takes the "OSTEMPLATE" Parameter from
your VE.conf which is located on the Node which is most probably filled
with something like "Debian/20061010"

Now upon boot of your VE certain scripts are started to set your
hostname and network config. If the given files are not available
Strato might shutdown your server.

Hope it helps :)

Regards,

Kristian Marcroft

actually the standard distro on Strato is Suse 9.3.. I bootstrapped
debian.. which worked.. and now I'm using the same method for gentoo..
