Subject: Lame question on fresh install of openvz

Hi everyone, i am having a quick question, please direct me. I just installed Debian 7 + XFCE and it has network-daemon that i set up with no problems with my wifi settings and vpn. After following directions in "debian installation guide" i booted into new kernel (after having set up everything said in the guide) and XFCE booted all fine but i couldnt help but notice that network manager didnt start. I am running eeepc 1001 that has funky wifi card and otheras something ethernet card so my best guess is that 2.6 kernell has no support for them and network-manager didnt find any network interface and failed silently. How do i go on solving this issue? Do i need to compile drivers? Do i need to compile openvz kernel? Can you direct me with a line or two of explanation and maybe a link to howto? Forumn search and quick googling didnt help. Thanks in advance.

I inspected the problem deeper and found out that the device drivers are there and interfaces are set up and the problem is in NetworkManager daemon. In its log file it first complains ("[warn]" message tag)that it can not connect to netlink (netlink -communication between kernel and user space) saying "data out of range" and then NetworkManager daemon recieves signal 11 (segmentation fault). Can somebody elaborate on this one? It would solve problems for future users of openvz who set it up on new debian 7.6.0. As far as i can tell it has to do with netlink interface differences in kernel 2.6 and new kernels and thats is why NetworkManager tries to access something out of range and recieves segmentation fault.

Thanks. I just want to mention that this affects all OpenVZ users, because OpenVZ
is still using a 2.6.32 kernel.

==================================

I guess its still not fixed.
