Hi Folks,

Our server crashed over the weekend. We have 3 containers. The most heavily used container shows this when issuing df -h inside the container

```
/dev/simfs     1.8T (size)   1.8T (used)  Avail 990M   100%   / mounted
none          2.0G  (size)  4.0K (used)  2.0G   1%
none          2.0G  (size)  8.0K (used)  2.0G   1%
```

How do I increase the size of /dev/simfs ?

I stopped the container, deleted the quota file and started it. This got the container up.

I just can't figure out how to increase the size of the file system.

Thanks

Jim

Hi,

increase your CT Volume via vzctl set command.

See our wiki : https://openvz.org/Disk_quota

Bye,
Thorsten
