Subject: Openvz Ploop showing 100%

Hi,

I have created an Openvz container with 24 Gb space.
Everything worked perfectly but now all of a sudden I can't copy files anymore into the container.
When I enter the container and check with "df - h", I get the following:

/dev/ploopXXXX/ 100% use and mount point is /

Other mountpoints are /dev and /run and there the used space is only 1%

How can I solve this issue?

What is this /dev/ploopXXXX ? I can't remember that this was present upon creation of the container.

Any help would be highly appreciated.

I see no errors, 'df -h' is simply telling you that your file system is full.

Do you have a reason to believe you should have more free space than it's currently reported?
