Subject: No VPS have Connectivity until "service network restart" from host machine

With my new node (CentOS 6.6, 64bit) I'm having issue with network connectivity from openvz containers. Every time I create or reboot container on this server, it is not possible to use network. venet interface inside container is up, but network doesn't work. I can only ping container from host node. When I run "service network restart" on the host node, everything starts working. But it's very annoying to run this after every new VPS or after reboot the vps.

I have in /etc/vz/vz.conf this line: "NEIGHBOUR_DEVS=all"

Someone please suggest what to do.
