Hi guys,

I really need CONFIG_IPV6_SUBTREES, which is disabled by default in kernel config.

If I enable it, I got following error while compiling my kernel.

Quote: CC [M] net/ipv6/ip6_fib.o

net/ipv6/ip6_fib.c: In function 'fib6_add':

net/ipv6/ip6_fib.c:918:1: warning: ISO C90 forbids mixed declarations and code

net/ipv6/ip6_fib.c:923:27: error: invalid storage class for function 'fib6_lookup_1'

net/ipv6/ip6_fib.c:1013:27: error: invalid storage class for function 'fib6_locate_1'

net/ipv6/ip6_fib.c:1073:25: error: invalid storage class for function 'fib6_find_prefix'

net/ipv6/ip6_fib.c:1095:26: error: invalid storage class for function 'fib6_repair_tree'

net/ipv6/ip6_fib.c:1196:13: error: invalid storage class for function 'fib6_del_route'

net/ipv6/ip6_fib.c:1309:12: error: invalid storage class for function 'fib6_walk_continue'

net/ipv6/ip6_fib.c:1383:12: error: invalid storage class for function 'fib6_walk'

net/ipv6/ip6_fib.c:1397:12: error: invalid storage class for function 'fib6_clean_node'

net/ipv6/ip6_fib.c:1436:13: error: invalid storage class for function 'fib6_clean_tree'

net/ipv6/ip6_fib.c:1477:12: error: invalid storage class for function 'fib6_prune_clone'

net/ipv6/ip6_fib.c:1487:13: error: invalid storage class for function 'fib6_prune_clones'

net/ipv6/ip6_fib.c:1503:12: error: invalid storage class for function 'fib6_age'

net/ipv6/ip6_fib.c:1564:13: error: invalid storage class for function 'fib6_gc_timer_cb'

net/ipv6/ip6_fib.c:1569:12: error: invalid storage class for function 'fib6_net_init'

net/ipv6/ip6_fib.c:1626:13: error: invalid storage class for function 'fib6_net_exit'

net/ipv6/ip6_fib.c:1640:2: error: initializer element is not constant

net/ipv6/ip6_fib.c:1640:2: error: (near initialization for 'fib6_net_ops.init')

net/ipv6/ip6_fib.c:1641:2: error: initializer element is not constant

net/ipv6/ip6_fib.c:1641:2: error: (near initialization for 'fib6_net_ops.exit')

net/ipv6/ip6_fib.c:1677:1: error: expected declaration or statement at end of input

net/ipv6/ip6_fib.c: At top level:

net/ipv6/ip6_fib.c:81:13: warning: 'fib6_prune_clones' used but never defined

net/ipv6/ip6_fib.c:83:25: warning: 'fib6_find_prefix' used but never defined

net/ipv6/ip6_fib.c:84:26: warning: 'fib6_repair_tree' used but never defined

net/ipv6/ip6_fib.c:85:12: warning: 'fib6_walk' used but never defined

net/ipv6/ip6_fib.c:86:12: warning: 'fib6_walk_continue' used but never defined

net/ipv6/ip6_fib.c:97:13: warning: 'fib6_gc_timer_cb' declared 'static' but never defined

net/ipv6/ip6_fib.c: In function 'fib6_add':

net/ipv6/ip6_fib.c:1677:1: warning: control reaches end of non-void function

make[2]: *** [net/ipv6/ip6_fib.o] Error 1

make[1]: *** [net/ipv6] Error 2

At least it doesn't work since 2.6.32.113.11. I don't have all history patch, so I can't find in which revision it stopped working.

And it was working in 2.6.32.57.7.

So this is clearly a regression.

May someone skilled in kernel source can fix it ?

Thanks,

PS : GCC compiler v4.5.x

I've isolated the problem, it's between 079.6 and 085.20
