Subject: OpenVZ 7 option ipv4.ip_nonlocal_bind in containers

Hi,

I have a question about option "ipv4.ip_nonlocal_bind" in container. In the OpenVZ 7 containers I don't see this option, in kernel parameters.

In the main host this option exist and is enabled
# sysctl -a |grep bind
net.ipv4.ip_nonlocal_bind = 1
net.ipv6.bindv6only = 0
net.ipv6.ip_nonlocal_bind = 0

but on the containers I don't see this option, only net.ipv6.ip_nolocal_bind is available

sysctl -a |grep bind
net.ipv6.bindv6only = 0
net.ipv6.ip_nonlocal_bind = 0

Is a possible to enable option "ipv4.ip_nonlocal_bind" in OpenVZ7 containers? Is there any limitations in this function in OpenVZ7?

Best regards
Krzysztof
