systemd goes 100% inside unsuspended containers after HN reboot.
So I have to set /etc/vz/vz.conf:
VE_STOP_MODE=stop

suspend not working for node reboot. bug or I am doing something wrong?

If I reboot machine. all containers coming up with systemd at 100% CPU. just suspend/unsuspen not making same trick. Need to reboot HN, so that VZ will suspend container.
