Hi,

we are running Virtuozzo 7 (3.10.0-514.26.1.vz7.33.22) in our environment.

In the past we set the DCACHESIZE in OpenVZ 6 to limit the usage of the dentry/inode cache.

We did this because we had some issues with growing dcaches causing OOM's on the machine.

In Virtuozzo we see that the dcache is growing again but we are not able to limit it because there ist no option in vzctl or prlctl any more.

How can i limit the dcachesize again?

Regards Hans
