Hello,

can anyone tell me how to set these parameters for a VPS with guaranteed 128MB memory and burstable to 256MB memory?

VMGUARPAGES="32768:2147483647"
OOMGUARPAGES="149791:2147483647"
PRIVVMPAGES="149791:164770"
KMEMSIZE="23055974:25361571"

Is there any other parameters needed to determine such a VPS?

Thanks a lot for any help.

RonyZ

Hello,

please, look at this page:http://wiki.openvz.org/UBC.
There is a menu at the right part of a screen, where you can
get complete information on parameters. After that, I suppose, you'll be able to configure you VE in a right way.

HTH,
vass.

Hi,

Thanks for your reply.

I have already read through those articles.

However, I still not sure about setting these parameters.

I really appreciate if someone can do this sample config file for me.

Thanks a lot!

RonyZ
