Hello, i have big problem with network.

I got dedicted server with two ip address.

I made openVZ with debian 9.0 template.

I have big problem, my openvZ cant join into internet. ping dont responde.

What should i do? I tried to disable venet and instead of it enable veth but my openVZ dont want to get up because it dont see any interface.

I tried to do everything what is here : https://openvz.org/Virtual_Ethernet_device but on step : Configure device in CT i have problem.
My openVZ dont see interface eth0 although i did it zctl set 101 --netif_add eth0, MAC:ADDRESS --save

Can icount for any help? Thank you!

Dear twige,
I'm sorry,
however unfortunately OpenVz have no free resources for support or investigations.

You can ask community via Users mailing list, however there are no guarantee that you'll geed any response.

Thank you,
  Vasily Averin

Sure, you can ask here, but the forum is not that frequently visited. Anyway, for starters, take a look at the sticky "How to report networking-related problems" and also at the note in red at the top page of the forum. Basically, we need more information.

Also, before trying anything else, I'd try creating a VM with the same OS as your HW node is, to test with. For example, if you use the OpenVZ 6 CentOS node, create a Centos 6 VM. OTOH, if you use an OpenVZ 7 node, create a CentOS 7 VM to test with and go from there.
