Subject: Error after kernel update.

Good evening, after the problem with the iproute pack and the number of vps that were failing, today we have updated to the new OpenVZ7 kernel.

All the nodes have been raised perfectly (+10) but there are 3 that although the virtual machines are working, they have not started automatically and we have had to do it one at a time.

Now the problem: any use that we want to give to prlctl gives the same error:

[root@server14e4 ~]# prlctl list
Login failed: Unable to connect to Virtuozzo. You may experience a connection problem or the server may be down. Contact your Virtuozzo administrator for assistance.

And it happens because the service has been activated:

[root@server14e4 ~]# service prl-disp status
Redirecting to /bin/systemctl status prl-disp.service

Loaded: loaded (/usr/lib/systemd/system/prl-disp.service; enabled; vendor preset: enabled)
Active: inactive (dead)

If we try to activate the process, it stays thinking and does not give an error or activate.
Also, in the logs we do not see anything.
Will it have something to do with the release of experimental repositories?

It's weird because there are more than 10 nodes where it worked correctly.

I hope you can help me find a solution. Thank you!
