Greetings,

I started installing OpenVZ on a CentOS 7 (64 bit) server,
but encountered kernel issues.

[root@lol ~]# rpm --import http://ftp.openvz.org/RPM-GPG-Key-OpenVZ
[root@lol ~]# yum install vzkernel

You could try using --skip-broken to work around the problem
You could try running: rpm -Va --nofiles --nodigest
[root@lol ~]#

What is the problem?
What do I need to install or uninstall to successfully install vzkernel?

Thank you in advance for your answers!
