Subject: Openvz 8?

Greetings, I've been using openvz (and virtuozzo) since version 5. It's still my go to solution, and believe me, I've tried them all.

I'm beginning to wonder if OVZ-7 is the end of the road. Is there some plan for OVZ-8? I've heard no official word or even unofficial chatter about OVZ-8 lately, and I'm starting to cast about to make sure there are alternatives, in case this is a dead end.

Can you confirm or deny that there will be a Centos-8 based release of OVZ?

A clear word would do much to give us some much needed peace of mind.

Hi!

At last i do have something to provide you officially:
tomorrow (29.09.2020) there will be a webinar from Virtuozzo and there will be slides about roadmap.
Speakers: director of our RnD and our Product Manager.

Official slides.

The banner for registration (just to get a link, no cost of course) is on openvz.org now, here is the link as well: https://bit.ly/2Ekkodo

Hope, that will vanish all the doubts about the future - there will be OVZ8! :)

Have a nice day!

So in light of CentOS making new direction to CentOS Stream

https://https:// lists.centos.org/pipermail/centos-announce/2020-December/048 208.html

i was wondering if this will affect OpenVZ plans for OpenVZ 8

I see that cloudLinux SEO is announcing new RHEL 8 distro, so i was wondering how this can/will affect OpenVZ8

Thank you

Hi,

yes, every "iron" translates this new nowadays, so your question is definitely valid and expected. :)

Fortunately this will not affect OpenVZ 8 anyhow - even at the moment we don't use CentOS as a base,
we do rebuild RHEL packages ourselves (it's just faster then waiting for CentOS packages).

The only interesting question here is - what is going to be with CentOS-based Containers.
This is not decided yet: definitely we will suggest some way (the best way, of course! :)).

There will be probably a new template(s?) instead of CentOS one for new Containers -
it might be another incarnation of our own VzLinux (or whatever name will be chosen) or
template of RockyLinux/OracleLinux/CloudLinux/etc - there are a lot of them appeared right after announcement of stable CentOS death.

Thank you Khorenko on your detailed reply, glad to hear we wont have problem at least with OpenVZ, although with OpenVZ8 we will definitely be switching to full OpenVZ8 that is virtuozzo linux iso, since we've been relying on CentOS7 for current version which is not ideal, but with help of KVM our provider now gives us ability to install custom ISO, but hopefully with OpenVZ8 will be shipped some script similar to OpenVZ7 which converts then popular RHEL like distro to full OpenVZ8 which would simplify instalation without using KVM. I am willing to test it localy and on servers if needed :)

That said, considering how virtuoozzo have already its own RHEL-like linux, you could use this to your advantage and make one Virtuozzo-VZ server like version and one 100% binary RHEL8 compatibile version for client containers and since the brand and parent company is well

established it could be interesting opportunity.

Kind regrads,
Vladimir Mitic
