Hello everyone
I'm trying to setup OpenVZ on a Slackware 10.2 HN
So far compiled and modified scripts to use the BSD init scripts (no
/etc/sysconfig) but I get this error:

vzctl start 101
Starting VE ...
VE is mounted
Unable to set capability: Operation not permitted
Unable to set capability
VE start failed
VE is unmounted
#

Can anyone provide me with some insight into possible causes of this error?
What is "vps.mount" and is it not included in the source code tarballs
for a reason?

Thanks
-Stuart

Hello,

can you, please, specify kernel version you're using and output of
`cat /proc/sys/kernel/cap-bound` command.

Thanks,
Vasily.

I fixed it!
Upon digging through the forums I found CONFIG_SECURITY seems to break
OpenVZ and I had the kernel (2.6.18-028test005) compiled with that
option. But thanks anyway!

BTW feel free to contribute your Slackware-specific initscript for vz
and we will include it into next vzctl release ;)
