Hi,

Ive just started to use OpenVZ and it totally rocks but one thing I would really like is to be able to add a decription to each VE - such that a vzlist might look like this

```
# vzlist
 VEID      NPROC STATUS  IP_ADDR         HOSTNAME    DESCRIPTION
 101          13 running 172.30.60.101   server101   Mediawiki box
 102           6 running 172.30.60.102   server102   Zenoss Network monitor
 103          13 running 172.30.60.103   server103   Webserver Dev box
 105           3 running 172.30.60.105   server105   Asterisk
```

How do I ask for it as a feature request? Or did I just do it

vzctl set <veid> --name something

that would come close to your request, only problem is that --name only accepts one word as a parameter

Well that sets the hostname but doenst allow a short description - I *think* it shouldnt be too hard to code. The description itself can be kept in the VEs confog file and VZLIST would have to be changed a little to read each config file

I think it would be really helpfull

no, --hostname sets the hostname
--name sets another variable the name shows up when you do 'vzlist -n'

I agree though, a description setting would be nice too

ah, I stand corrected. I think I will use this for the time being. I hope it can contain long words
