UPDATE: This was a weird Firewall-Issue on my HN!
My Thanks go to Vasily for pointing that out to me!

Hello everybody!

I have a problem with my OpenVZ-Installation under CentOS 4.4:
I have installed CentOS 4.4 Server-CD with minimal packages,
then installed OpenVZ and rebooted with OpenVZ-Kernel (2.6.9-023stab040.1)

I have then installed a new VPS.

HOST-IP: 80.190.1xx.220
VPS-IP: 80.190.1xx.221
GW: 80.190.1xx.1
DNS: 212.123.96.110

I can successfully connect via SSH from WAN into the VPS and also ping from WAN to VPS.
I can also ping from VPS into WAN but the nameserver-resolution is not working
The DNS-Resolution on the host is working perfectly.

Can anybody help me here?
I have already tried everything I know and read the whole wiki...

Thanks in advance a lot for all of your help

Best regards,

Chris

You need to run the --nameserver option on the ve.

I did

But that didn't change anything

I still have no dns-resolution in my VE...

Has anybody more tips please? I am really lost here

Thanks!

Best regards,

Christian

Try pinging an IP address instead of a domain name. Try yahoo.com at 216.109.112.135). If you can ping an IP, but not a domain name, it is a dns issue for sure.

Yes I can ping IPs in the WAN perfectly, just the nameserver resolution is not working

Help!

Thanks for all your efforts!

Best regards,
chris

Hello,

can you give me an access to your node? If yes, you can post login information via PM (Private Message). If no, answer here, and we'll try to help you remotely, but it defenetely will take more time.

Thanks,

Vasily.

Vasily,

you've got a PM

Thanks a lot for your help everybody!

Best regards,

Chris

How was the issue resolved?

Subject: Re: Nameserver Problem

It actually wa a firewall issue... iptables didn't let the dn queries out into the WAN for some reason... so that's working now sorry for not reporting back earlier...

best regards,
Chris

What firewall setting solved the issue?

I am not sure as I disabled the FW and activated an external FW "in front" of the VPS
