Hi! Anyone have a trouble with (open)virtuozzo and nfs?
When I compile kernel vzkernel 2.6.8-022stab032.1 with support NFS server v3 and v4 nfs daemon don't start.
Today I'll try to post hear errors about it, but maybe it have to doing in other place? (like bugzilla & )
And what additional information could be usefull from me exept kernel .config and tail -f /var/log/messages?

yes, please post bugs to http://bugzilla.openvirtuozzo.org/

sure you have to include kernel .config and kernel logs

Bug entered to bugzilla:
http://bugzilla.openvirtuozzo.org/show_bug.cgi?id=39

patch sent, should be fixed in next kernel release.

Thank you, I even am confused , what it was not in time to me to make full bug report with logs. I will try to do it in next time faster, but I hope where is no next time =).

Is where any restrictions to to setup vz on diskless station with root fs on nfs? (Certainly I understand, I will have Losses in productivity, but it's no matter in tis case)

We don't try, but you can
Theoretically, there should be no restrictions. But simfs over nfs combination isn't checked.

Ok, I will try, but with new kernel
And ofcourse I will make bug report if.
