Hey, guys.
Here's the tech's concern:

> Here is the link that describes a work around for the openvz problem. Note
> that fedora core 6 64bit has not been tested. The first paragraph titled

Any comments?

Sorry - I forgot to mention this probably-relevant fact:
I have no intention of using vzrpm or vzyum.

I prefer to work within the VE, so I'd either use "vzctl exec" or just
enter the VE and run yum as usual.

Are there any plans by the openvz team to fix the problems with vzyum/vzrpm
on the 64 bit arch?

Romeo

That still leaves the template handling. Sure, it's doable by hand, in
fact that's how I do it, but it's not nice.

/Benny
