Subject: CTRL-C not working inside VPS

I cannot use CTRL-C to cancel a process (like for instane tail -f) in any VPS. Only thing that works is killing the process with a new SSH instance or killing the process ID from the node.

Interestingly CTRL-C is working on the node...

Is this a setting somewhere?

Thanks.

It works for me in both cases (ssh into a VE, vzctl enter, vzctl exec — in the last case vzctl exits).

So can you give us some more details? Your terminal emulator, your OS template, etc.

Well, my node is Debian Etch with kernel 2.6.20.

The OS Templates that seem not to understand CTRL-C are actually all of them. I mainly work with Ubuntu and Debian VEs (official ones from openvz.org).

Terminal Emulation: no clue... don't know how to find that out. But I have attached my current kernel config - maybe that helps.

By terminal emulator I mean a program like xterm, rxvt, putty, gnome-terminal etc.
