Problem with vzdump.....
check this out any help would be great

```
# vzlist
      VEID      NPROC STATUS  IP_ADDR         HOSTNAME
         1         45 running
         2         55 running
         4         50 running
        32         64 running
        34         51 running
        50         45 running
        55         45 running
        56         50 running
        57         48 running
        58         50 running
      1000         54 running
```

(i blanked ips and hostnames

```
# vzdump --dumpdir /tmp -stop 2
ERROR: strange VPS ID '2'
```

only works for vps 1000

Thanks for your help!

Hello.

This is not a bug, but feature. According to OpenVZ User's Guide http://download.openvz.org/doc/OpenVZ-Users-Guide.pdf page 32 (Choosing private server ID): "... OpenVZ reserves the IDs ranging from 0 to 100. Though OpenVZ uses only ID 0, different versions might use additional Virtual Private Servers IDs for internal needs. To facilitate upgrading, please do not create Virtual Private Servers with IDs below 101. ..."

So, VEs should be renumbered according to the requirement.

Thanks very much
sorry to not read the RTFM closely
