I have a CentOS 5 server I'm trying to get setup with OpenVZ. I decided to try the yum install method.

I get the following error when I try to install vzyum and vzpkg
--> Populating transaction set with selected packages. Please wait.
---> Package vzpkg.noarch 0:2.7.0-18 set to be updated
---> Package vzyum.noarch 0:2.4.0-11 set to be updated
--> Running transaction check
--> Processing Dependency: cElementTree.so for package: vzyum
--> Finished Dependency Resolution
Error: Missing Dependency: cElementTree.so is needed by package vzyum

I did a yum update. Many packages are installing the x86_64 version as well as the i686. Why are non 64bit packages being installed?

Since I didn't manually install the RPMs, how do I ensure the right kernel has been installed?

I thought I excluded the regular kernel from yum installation, but:

[root@Char mhammett]# rpm -qa | grep kernel
kernel-2.6.18-8.el5
ovzkernel-2.6.18-8.1.8.el5.028stab039.1
ovzkernel-2.6.18-8.1.8.el5.028stab039.1
ovzkernel-devel-2.6.18-8.1.8.el5.028stab039.1
kernel-headers-2.6.18-8.1.8.el5
ovzkernel-devel-2.6.18-8.1.8.el5.028stab039.1
[root@Char mhammett]# rpm -e kernel kernel-headers
error: Failed dependencies:
kernel-headers >= 2.6.18 is needed by (installed) audit-libs-python-1.3.1-1.el5.x86_64

You also need python-cElementTree i386:
rpm -ivh http://mirror.centos.org/centos/5/os/i386/CentOS/python-elem enttree-1.2.6-5.i386.rpm

It should solve your problem

I tried to use yum provides to pull up the missing files, but yum had refused to install. Your route seemed to do the trick.

As an FYI to those searching the thread later, there's a space in the url above that causes it to not download.

http://mirror.centos.org/centos/5/os/i386/CentOS/python-elem enttree-1.2.6-5.i386.rpm
