Hi!

I have a problem while freezing my VEs.

Here is the log:

Aug 16 23:31:46 cl3002-1 kernel: VPS: 102: stopped
Aug 16 23:31:57 cl3002-1 kernel: VPS: 111: stopped
Aug 16 23:32:02 cl3002-1 kernel: VPS: 112: stopped
Aug 16 23:32:03 cl3002-1 kernel: VPS: 124: stopped
Aug 16 23:32:13 cl3002-1 kernel: VPS: 125: stopped
Aug 16 23:32:13 cl3002-1 kernel: Ub 125 helds 172920 in tcpsndbuf on put
Aug 16 23:32:21 cl3002-1 kernel: VPS: 126: stopped
Aug 16 23:32:27 cl3002-1 kernel: VPS: 127: stopped
Aug 16 23:32:27 cl3002-1 kernel: VPS: 128: stopped
Aug 16 23:32:29 cl3002-1 kernel: VPS: 129: stopped
Aug 16 23:32:29 cl3002-1 kernel: Ub 129 helds 238408 in tcpsndbuf on put

It doesn't seem there is a problem, but I'd like to know what this warning/error means. I know it is the TCP send buffer.
VEs are running Webservers.

Any info is welcome. Thanks in advance.

Thomas

It is minor bug: resource leakage or errors in tcpsndbuf accounting.
If you knows how to reproduce such issues -- it's very interesting for developers.

And the version of the kernel you use, please =)

version from Kernel 2.6.9

Couldn't reproduce error.
VEs were running Apache with MySQL database.

Sorry can't do much testing because its a productive server.

Thanks anyway
