Pavel,

I noticed that fcntl tests in LTP fail when LTP is run a child pid namespace. I just hacked up this quick patch and seems to fix the failures.

Are you already working on this or do you want me to test and send this out for review.

I have one concern that I could use some review/confirmation :-)

Even if the main thread of a process exits before the child threads, the main thread will not be reaped until all threads exit. So, the 'task->group\_leader' remains valid for the child threads until the last non-leader thread exits.

IOW the call to task\_tgid\_vnr() is safe in locks\_remove\_posix() and locks\_remove\_flock().

Well, I missed this place deliberately. This should be converted into  
struct pid \* usage. I will do the appropriate patch soon.
