Subject: Couple of rpm requests, 2.6.22

Hey all!

Not sure if I should post this for discussion or just file these requests in bugzilla. I'll do both... :-)

I've got a couple of requests for some changes in the rpm builds, now that development is on 2.6.22.

2.6.22 includes MD5 tcp signatures which are necessary for IPv4 passwords on BGP sessions (quagga w/ password patch). The default builds for Fedora 2.6.22 builds include this option but it has not been enabled in the OpenVZ builds. Any chance of getting that slipped in for the next release (which I understand should also fix the netfilter problems?).

I also noticed that SIT tunnels for IPv6 are not enabled in the build, which is a standard default option for all RedHat / Fedora / CentOS builds.

The RedHat and Fedora builds include development rpm's. I maintain a couple of kernel modules and often build outside of the kernel, so I need the development bits and pieces. I'm curious why a "devel" package isn't similarly provided with the 2.6.22 packages.

These are sort of show stoppers for me which require I rebuild the rpms from srpm for some of my systems, where the 2.6.22 kernel is required.

Regards,
Mike
