
Subject: [patch 0/1] fix veth netif_carrier_off
Posted by [Daniel Lezcano](#) on Tue, 18 Sep 2007 16:56:45 GMT
[View Forum Message](#) <> [Reply to Message](#)

When I tried the veth driver, I fall into a kernel oops.

```

That happens when trying to add the veth driver using the ip command:

```
ip link add veth0
```

which fail.

It appears that the `netif_carrier_off` is placed into the `setup` function and this one is called before `register_netdevice`.

The `register_netdevice` function does a lot of initialization to the `netdev` and if the `netif_carrier_off` is called before the `register_netdev` function, it will use and trigger an event for an uninitialized `netdev`.

Subject: [patch 1/1] fix bad `netif_carrier_off` place
Posted by [Daniel Lezcano](#) on Tue, 18 Sep 2007 16:56:46 GMT
[View Forum Message](#) <> [Reply to Message](#)

From: Daniel Lezcano <dlezcano@fr.ibm.com>

If the `netif_carrier_off` is called before `register_netdev` that will use and generate an event for a non initialized network device and that leads to a Oops.

I moved the `netif_carrier_off` from the `setup` function after each `register_netdev` call.

Acked-by: Pavel Emelyanov <xemul@openvz.org>

Eric, if you managed to reproduce your oopses, does this patch help?

BTW, this problem exists for some other drivers, no? E.g. xpnet_init() does the same thing and probably oopses as well.
