Hello

-I m trying to test Openvz in my new Laptop DELL inspiron
i have a SATA hard disk an i m using Centos 4.2 updated
-i installed the RPM ovzkernel-2.6.8-022stab072.2.i686.rpm

```
rpm -ivh ovzkernel-2.6.8-022stab072.2.i686.rpm
attention: ovzkernel-2.6.8-022stab072.2.i686.rpm: signature V3 DSA: NOKEY, key ID a7a1d4b6
Préparation... ##### [100%]
 1:ovzkernel ##### [100%]
WARNING: No module ata_piix found for kernel 2.6.8-022stab072.2, continuing anyway
```

i followed the instruction here <http://openvz.org/documentation/guides/installation/quick-in> stall

and when i reboot , i have this error :
Kernel Panic ...

(jpg attached)

thank you for your help , i searched in the forum , and i tried some solution without success

Can you try our beta kernel (from <http://openvz.org/download/beta/kernel/>)? If it works, please file a bug (using <http://bugzilla.openvz.org/>) to the kernel, giving the details of the case, and adding lspci and lspci -n for you machine.

OK ,

-I report the bug of the kernel ovzkernel-2.6.8-022stab072.2.i686.rpm in bugzilla with lspci

-I used the ovzkernel-2.6.16-026test005.1.i686.rpm , i can boot now, but there is no modules for my network card b44, so i didn't have the network working, and i can't continu

Thanks in advance

Try loading tg3 driver:
modprobe tg3

There are 2 drivers for your ethernet adapter, maybe this caused the mess.
