Hi,

I want to use ACL in a VE.

as you can see, on the hardware node, i changed fstab to have acl activated :

```
/dev/md0            /                ext3    defaults,acl        1 1
none                /dev/pts         devpts  gid=5,mode=620  0 0
none                /dev/shm         tmpfs   defaults        0 0
none                /proc            proc    defaults        0 0
none                /sys             sysfs   defaults        0 0
/dev/md2            /vz              ext3    defaults,acl        1 2
/dev/md1            swap             swap    defaults        0 0
/dev/hda            /media/cdrom         auto    pamconsole,exec,noauto,managed 0 0
/dev/fd0            /media/floppy        auto    pamconsole,exec,noauto,managed 0 0
```

Is there something more to do because when i am in my VE, it seems that i don't have the setfacl or getfacl command :

```
[root@HN2 ~]# vzctl enter 101
entered into VE 101
[root@DATA /]# setfacl
-bash: setfacl: command not found
[root@DATA /]#
```

I searched on the forum but didn't find a lot about acl.

any help would be apreciated !

thnks

David

thks for the reply.

I had already tried to install yum in my ve and made a yum install acl libacl to have it and it worked.

is is the same or do you think i have to use your method via the vz pckg ?

David
