Subject: [PATCH 0/3] Sysctl shadow management
Posted by Pavel Emelianov on Tue, 20 Nov 2007 11:38:36 GMT
View Forum Message <> Reply to Message

Hi guys!

You all know, that with multiple namespaces we have to take special care about sysctls. E.g. IPC sysctl handlers are equipped with kludges to alter the sysctl parameters of appropriate namespace. The same thing should be done for UTS namespace (but it is not - we have a BUG in mainstream) and (!) for network namespaces.

Unlike all the other namespaces, network will have to not just address different variables via same sysctl names, but to have different tables with different sysctl names. E.g. /proc/sys/net/conf have entries for devices, which differ across namespaces.

Eric currently have some work done in that directions, I like the approach in general very much, but it looks rather raw (Eric, take this in good part). You know, ifdefs in the middle of the code, explicit references to net namespace and so on and so forth.

So here's the RFC for a bit better sysctls shadow management.

I will provide 3 patches:
1. the sysctl shadows themselves;
2. using shadows in UTS namespace;
3. using shadows in IPC namespace;

If someone want I can send

4. example on how to create a /proc/sys/net/conf/-like structure with different names.

Using them in net namespace is already checked (I created sysctl entries with different names), but I don't have any patches against any David's tree yet. If we're OK with this set I will start talking to Andrew and David about who to send these patches to and making shadows for net-related sysctl variables.

Subject: [PATCH 1/3] The sysctl shadows
Posted by Pavel Emelianov on Tue, 20 Nov 2007 11:43:42 GMT
View Forum Message <> Reply to Message

The sysctl shadow is nothing but a ctl_table_head, that
hides behind some other one and which is used in
proc_sys_readdir, proc_sys_lookup, etc when scanning
through the list of these heads.

Each "shadow" carries its own set of ctl_tables that
are relevant to this shadow. The appropriate shadow
is get via the ->shadow() callback on the head.

When putting the shadow back (unuse it) one should
work with the shadow->origin head.

The API:
 * register_sysctl_table_shadow: registers the ctl
   table and tells that is will be shadowed with
   the specified callback;
 * create_sysctl_shadow: clones the original head's
   table and creates a shadow for it. The caller then
   may move the ctl_table->data pointer on the new
   (shadow) tables to point to another variables.
   It may also change names for tables, etc;
 * free_sysctl_shadow: destroys the shadow.

Subject: [PATCH 2/3] Switch UTS namespace to use shadows
Posted by Pavel Emelianov on Tue, 20 Nov 2007 11:45:51 GMT
View Forum Message <> Reply to Message

The uts sysctl table contains two writable fields
(domainname and nodename), so split the table into
common (read-only) part and writable (shadowed).

This fixes the BUG! You may create a namespace and
then writing to /proc/sys/hostname will cause an
init_uts_ns overwrite.

The same as with UTS - use the shadows. With this

there's no longer need in having kludged ->proc_handler
and ->strategy for ctl_tables.

> namespace (but it is not - we have a BUG in mainstream) and
> (!) for network namespaces.

The bug in mainstream was introduced by commit:
7d69a1f4a72b18876c99c697692b78339d491568

Thee code should read:

```
 static void *get_uts(ctl_table *table, int write)
 {
  char *which = table->data;
+ struct uts_namespace *uts_ns = current->nsproxy->uts_ns;
+ which = (which - (char *)&init_uts_ns) + (char *)uts_ns;

  if (!write)
   down_read(&uts_sem);
  else
   down_write(&uts_sem);
  return which;
 }
```

And for 2.6.24 we should just restore the two missing lines.

> Unlike all the other namespaces, network will have to not
> just address different variables via same sysctl names, but

> and so on and so forth.

Sure. I don't in principle have any problem with the set of
roots we go through be dynamic at run time instead of compile
time. That is probably a cleaner approach and likely to solve
my problem with sched_debug registering sysctls before the
sysctl subsystem is initialized.

One direction I have always intended to expand things when
there was a bit of time to modify /proc/sys so that it
is a symlink to /proc/self/sys. Then make /proc/<pid>/sys
have cachable dentries for the sysctls.

To achieve that we need to pass our namespaces into
your shadow function. Instead of always using current.

So I am thinking something like:

```
struct ctl_table_root {
 struct list_head ctl_entry;
 struct ctl_table_header *ctl_head;
 struct ctl_table_header *lookup_ctl_head(struct nsproxy *namespaces);
};
```

To actually handle the set of network devices in a namespace we need
to have a list so making sysctl_head_next just loop over a list of
lists should be no extra work and make implementing the users
easier.

Beyond that through from my quick skim I have a preference for
the way I am handling it.

We really need to add the tables with some variant of
register_sysctl_table or else we will have module unload races.

Introducing register_sysctl_paths is a very useful cleanup in
it's own right and it helps quite a bit. In most cases it removes the
need for your create_sysctl_shadow function, and it always reduced the
amount of code for tables.

Further simply using kmemdup instead of a custom crafted function
is a little more straight forward and is the idiom already
established throughout the networking code.

Then we will just need a base sysctl function:

```
struct ctl_table_header *
register_sysctl_rooted_paths(struct ctl_table_root *root,
    struct nsproxy *namespaces,
    struct ctl_path *path,
    struct ctl_table *table)
```

For the simple namespaces we can call it once per namespace
after registering our root (we can't use current because we initialize

things before we update nsproxy), and we still need to run
sysctl_check.

For the more complex namespaces (i.e. the network namespace). We can
write a simple wrapper around register_sysctl_rooted_paths.

And of course non-namespace specific sysctls can just use a wrapper
that assumes the default global list of sysctl_headers.

Your patches look fairly reasonable. Other then the pieces
I have mentioned already.

> Using them in net namespace is already checked (I created
> sysctl entries with different names), but I don't have any
> patches against any David's tree yet. If we're OK with this

> sysctl variables.

I think we need another round. My hunch is that it will be easiest
if David collects them up, and then Andrew updates his tree, but
we will see.

Eric

Yup. I didn't want to submit this set as a fix.
On the other hand, I do not quite like the kludges
like above...

>

In this case you implicitly create some "sysctl namespace".
But this is not true. You may have tasks sharing net
namespace with their different sysctl entries and with
common ipc namespace with their common entries. And tasks
in same net namespace with different ipc ones and many
many over mixtures... This is unclean on how to treat
such per-process sysctl tree.

Shadows just make sysctls work somewhat independently
from namespaces.

> To achieve that we need to pass our namespaces into
> your shadow function. Instead of always using current.

Current is OK for now. At least this gives you 100%
guarantee that one namespace will never hack sysctls
from the other ones.

Agree. This piece of work is a "must-have". Are you going to go

on with it or may we take care?

But the shadows allow us move further with the net namespaces,
while paths are mostly cleanups. Important but cleanups.

OK. This is just a launchpad. Sure, this will be expanded further.

Hm... Ok then I think I will start virtualizing sysctls in unix
sockets (as they are already in net-2.6.25) with sysctl shadows
and send this stuff to David. Hopefully he will agree to accept
this :) After the next round we'll have that at Linus and go on
with ipc, uts, paths and so on.

Looks like we now have a "Looks-good-to:" subscript now :) May
I put yours in this set?

To be very very very clear.

This is the way I think we should do the core sysctl infrastructure.

On top of the register_sysctl_table patch, getting all of the
infrastructure in at once.

With a list of lists so we don't kill ourselves when we try to
implement sysctls that are per network devices.

I'm not yet finished testing and reviewing the code yet but I
think this is pretty close.

>From 7a0ab8b4d471fb1f2721150a5b1737a6e407b7b8 Mon Sep 17 00:00:00 2001
From: Eric W. Biederman <ebiederm@xmission.com>
Date: Tue, 20 Nov 2007 07:51:50 -0700

Subject: [PATCH] sysctl: Infrastructure for per namespace sysctls

This patch implements the basic infrastructure for per namespace sysctls.

A list of lists of sysctl headers is added, allowing each namespace to have
it's own list of sysctl headers.

Each list of sysctl headers has a lookup function to find the first
sysctl header in the list, allowing the lists to have a per namespace
instance.

register_sysct_root is added to tell sysctl.c about additional
lists of lists. As all of the users are expected to be in
kernel no unregister function is provided.

sysctl_head_next is updated to walk through the list of lists.

__reegister_sysctl_paths is added to add a new sysctl table on
a non-default sysctl list.

Hm... My patch looks to do very very same thing, but in
a bit simpler manner. Except for the absence of the
sysctl paths, but they are just cleanups. I think I can
port them on top of my shadows :) Thanks

> I'm not yet finished testing and reviewing the code yet but I
> think this is pretty close.

Thanks,
Pavel

Then slow down and listen.

Your code simply does not address module unload races. BAD BAD BAD.

Your code skips sysctl_check allowing buggy sysctl tables to continue
to exist BAD BAD BAD.

Your code does not implement a list of lists needed to implement
a dynamic list of network devices, instead leaving it to the user of
sysctl registration code to do. (Which is where the bulk of your
simplicity seems to come from). BAD BAD BAD.

So I'm sorry. Your code is simpler because it is WORSE.

Your code is race prone, encourages buggy users, and doesn't even
solve the same problem. So no I don't think it makes a bit
of sense.

Eric

>
> Are you worried about the recursion at all?

I do, but

1. sysctl tables are _never_ deeper than 5 levels (as they
   always come from the kernel space)
2. registering sysctl tables happens from __init calls usually
   so the stack is not filled at all
3. after implementing the sysctl paths this will vanish ;)

Moreover, this is not the only case of recursion in the kernel :)

Thanks,
Pavel

Can you unload IPC or UTS module? =)

> Your code skips sysctl_check allowing buggy sysctl tables to continue

The tables are cloned from those who passed these checks. ;)

Do we need this stuff for IPC? UTS? Stick to the patches please.

Network sysctls are more complex, I know it. Multiple shadows
per-head are to be done. I agree with that. I'm not trying
to create the most generic code that can solve all our needs
at once.

These patches do not provide any facility to display the
information via sysfs. So? Does anybody care about it?

I already have a bad experience with sending
doing-it-all-in-one-go patches to the community.

Subject: [PATCH 0/4] Sysctl namespace support
Posted by ebiederm on Thu, 29 Nov 2007 17:40:24 GMT
View Forum Message <> Reply to Message

Currently the network namespace work has gotten about as far as we can
without the ability to make sysctls that are per network namespace.

The techniques we have been using for other namespace of examining
current and replacing the ctl_table.data field depending on the
namespace instance that current->nsproxy refers to are both ugly
and do not work for the network sysctls.

The case in handling the networking sysctls that does not work with
the existing ugly pointer munging techniques are directories like
/proc/sys/net/ipv4/conf/ and /proc/sys/net/ipv4/neigh/ whose contents
vary depending on the networking devices present in the network
namespace.

Adding support to the sysctl infrastructure to allow to register
a sysctl table for a particular instance of a particular namespace
removes the need for magic sysctl methods, and allows the use
of the techniques for managing dynamic sysctl tables used for years
in the network stack.

Herbert we need this infrastructure most in net-2.6.25 (as not having
it is a current bottleneck to further development of the network
namespace) so these patches are against net-2.6.25.

Andrew also need this infrastructure in -mm so that we can take
advantage of this new infrastructure when implementing other
namespaces.

So I expect the sane way to deal with this patchset is to merge into
both net-2.6.25 and -mm and then Andrew can drop or disable the
patches once he pulls bases -mm on a version of net-2.6.25 with
the changes.

Subject: [PATCH 1/4] sysctl: Add register_sysctl_paths function
Posted by ebiederm on Thu, 29 Nov 2007 17:45:10 GMT
View Forum Message <> Reply to Message

There are a number of modules that register a sysctl table
somewhere deeply nested in the sysctl hierarchy, such as
fs/nfs, fs/xfs, dev/cdrom, etc.

They all specify several dummy ctl_tables for the path name.
This patch implements register_sysctl_path that takes
an additional path name, and makes up dummy sysctl nodes
for each component.

This patch was originally written by Olaf Kirch and
brought to my attention and reworked some by Olaf Hering.
I have changed a few additional things so the bugs are mine.

After converting all of the easy callers Olaf Hering observed
allyesconfig ARCH=i386, the patch reduces the final binary size by 9369 bytes.

.text +897
.data -7008

```
   text    data     bss     dec     hex filename
  26959310        4045899 4718592 35723801        2211a19 ../vmlinux-vanilla
  26960207        4038891 4718592 35717690        221023a ../O-allyesconfig/vmlinux
```

So this change is both a space savings and a code simplification.

Subject: [PATCH 2/4] sysctl: Remember the ctl_table we passed to register_sysctl_paths

Posted by ebiederm on Thu, 29 Nov 2007 17:46:26 GMT

View Forum Message <> Reply to Message

By doing this we allow users of register_sysctl_paths that build
and dynamically allocate their ctl_table to be simpler. This allows
them to just remember the ctl_table_header returned from
register_sysctl_paths from which they can now find the
ctl_table array they need to free.

Subject: [PATCH 3/4] sysctl: Infrastructure for per namespace sysctls
Posted by ebiederm on Thu, 29 Nov 2007 17:51:50 GMT

View Forum Message <> Reply to Message

This patch implements the basic infrastructure for per namespace sysctls.

A list of lists of sysctl headers is added, allowing each namespace to have
it's own list of sysctl headers.

Each list of sysctl headers has a lookup function to find the first
sysctl header in the list, allowing the lists to have a per namespace
instance.

register_sysct_root is added to tell sysctl.c about additional
lists of sysctl_headers. As all of the users are expected to be in
kernel no unregister function is provided.

sysctl_head_next is updated to walk through the list of lists.

__register_sysctl_paths is added to add a new sysctl table on
a non-default sysctl list.

The only intrusive part of this patch is propagating the information
to decided which list of sysctls to use for sysctl_check_table.

I've applied them all to net-2.6.25 with Andrew's fixes included.
Thanks Eric.

> Thanks Eric.

Welcome, and thanks.

I will see about taking advantage of this shortly.

Eric
