Hi Dietmar and all...

I have another suggestion for VZDUMP, if you don't mind. Like most people, I have been using it for backup of VPSs. I have a number of VPSs that generate a large number of files that don't need to be backed up. One VPS, for example, itself backs up databases by dumping their files. Another generates zone files periodically, and so on.

Dumping these VPSs takes a lot of time and disk space. The reason I dump them is for their configuration, not for their data.

If it was possible to exclude certain files, either by location of by a name spec, or both, from the dump, that would be fantastic.

Just a thought, thank you for your hard work and contributions!

Jim

just use the --exclude-path option

--exclude-path REGEX exclude certain files/directories

see the manual page for details (man vzdump)

Thanks Dietmar, I had an older version of VZDUMP installed. It's upgraded
now.

Jim
