Hello,

i've just installed the openvz packages for fedora core 5. When I tried
to run vzpkgcache -f fedora-core-5 I got this:
vzpkgcache -f fedora-core-5
Creating cache for fedora-core-5-i386-default OS template
ERROR: Can't start VPS 100002

I ran this with strace -f to see what might be the cause and I came
across this:
[pid 10368] open("/usr/lib/locale/locale-archive", O_RDONLY|O_LARGEFILE) = 0
[pid 10368] fstat64(0, {st_mode=S_IFREG|0644, st_size=54062576, ...}) = 0
[pid 10368] mmap2(NULL, 2097152, PROT_READ, MAP_PRIVATE, 0, 0) = 0xb7d3d000
[pid 10368] close(0)   = 0
[pid 10368] ioctl(0, SNDCTL_TMR_TIMEBASE or TCGETS, 0xbfc45af8) = -1
EBADF (Bad file descriptor)
[pid 10368] unlink("/vz/tmp/XX0dwVO")   = -1 EISDIR (Is a directory)
[pid 10368] open(".", O_RDONLY|O_LARGEFILE) = 0
[pid 10368] fcntl64(0, F_DUPFD, 3)   = 11
[pid 10368] close(0)   = 0

So something with ioctl() probably went wrong. Could this be because of
the fedora core 5 kernel ? I've installed the fedora core 5 kernel from
the openvz website and the vzctl and vzquota were complaining about
missing vzkernel and vzkmod-quota but I've installed them with --nodeps
(the vzquota module is there and was successfully loaded after "service
vz start"). Also I've booted the openvz kernel:
uname -r
2.6.16-1.2080_FC5.026test007

regards,
Aleksandar

Hello,

which vzctl version do you have? try vzctl-3.0.0-2, as latest vzctl for
i686 has one bug which leads to this err msg.
Will be updated today.

Thanks,
Kirill

Alexander (and everybody else who's having the same problem),

We have just released vzctl-3.0.0-8 which should fix the issue with
non-working vzpkgcache.

Changelog: http://openvz.org/news/updates/vzctl-3.0.0-8

Download: http://openvz.org/download/utils/vzctl/3.0.0-8

We apologize for any inconvenience.

Regards,
  Kir
