Hi all,

i am trying to setup a veth as described in:

http://wiki.openvz.org/Virtual_Ethernet_device

but vznetcfg script alwasy returns:

"According to /etc/vz/conf/.conf VE has no veth IPs configured."

Seems vznetcfg script has some errors, because it simply calls
EXTERNAL_SCRIPT without parsing parameters, i.e. VEID is not set.

Or do I miss something?

- Dietmar

From what I see, VEID is passed to vznetcfg via environment variable,
and vznetcfg script itself exports VEID before calling EXTERNAL_SCRIPT
-- so it should work at least in theory :)

Subject: Apache and MySQL together in VE not runnig reliable?

Hi!

We discovered, that apache and mysql running together in a VE will hang
(sometimes apache, sometimes mysql), when coming close to reserved
memory limit.

What could have caused this phenomenon?

We are working with stable gentoo distribution, uptodate.

tnx in advance, Guido Stepken

Any lines with failcnt>0 in /proc/user_beancounters for the problematic VE?
