Hi,

today i build the new 2.6.24er kernel from git.openvz.org. I had to disable checkpointing in order to get the kernel running, vz starts (the service) but i can not start my VEs which work(ed) perfectly und 2.6.22-ovz005. I compiled vzctl from git, too, but all i get is:
user@host:~$ sudo vzctl --verbose=10 start 999
Starting VE ...
Mounting root: /var/lib/vz/root/999 /var/lib/vz/private/999
VE is mounted
Set iptables mask 0x000017bf
Set features mask 0000000000000000/0000000000000000
VE start failed
Running: /usr/sbin/vzquota stat 999 -f
VE is unmounted

I don't get it, whats going wrong here?

Thx for any help!
