Hi there,

Does anyone know how to configure the HN Node to run "service network restart" when it fails? I am having a network failure once a day and until I find the problem I need a way to auto restart when the network stops.

Thanks,

Jim

You might need to write a shell script that keeps checking the status. and once it fails it will restart.

I am not on my machine now so the script might look like this

status= `service network status`

if status == " network is stopped" #check the output
do
service network start
done

run it in infinite loop

I wish this help
