Hi

im basically new with OpenVz software. Im trying into old Pentium III with 226 MB and works very good! Also I have a powerful server(Centos 4 minimal template) running now but I have seen a recurrently error in a VE log message.

Feb 13 09:54:11 191 sysctl: error: unknown error 1 setting key 'kernel.sysrq'
Feb 13 09:54:11 191 sysctl: error: unknown error 1 setting key 'kernel.core_uses_pid'

I saw this kind of error in another post of other people but i dont know if is serious.

Thanks.

That's OK. This just indicates that some task in ve tries to tune sysctl which is prohibited in ve.

Don't worry

However, if you're very sure that you do need some of sysctls, that are currently hidden or read-only in ve you may fill a BUG in our bugzilla with appropriate request. We'll look and decide whether this is safe to have this sysctl tunable in ve.
