Subject: 2.6.16 patch

Hello all,

patch-026test009-combined does not apply cleanly to 2.6.16.14, but
does to 2.6.16.

The date on the patch file is April 20, so presumably it does not have
all the -stable updates. Does anyone know which ones are missing?

I suppose I could find out the hard way, by attempting to apply each
one, but if someone else already knows ...

026test009 kernel includes mainstream patches up to 2.6.16.8. What is
inside our kernels you can check on git (http://git.openvz.org). On Git
we already have more recent 026test011 kernel which will be released soon.

If you care for security, I must note that 026test009 has lack for these
2 patches only:
[PATCH] smbfs chroot issue (CVE-2006-1864)
[PATCH] i386/x86-64: Fix x87 information leak between processes
(CVE-2006-1056)

The first one is relevant only if you do chroot on smbfs, which is
unlikely :) The second one is minor and is a small information leak (1
bit from FPU AFAIR).

So you need to apply a patch 2.6.16.8 -> 2.6.16.14 if you want.

Kirill
