Subject: Debian / Ubuntu add_ip.sh scripts give problems

Hi, I'm using openvz with some debian / ubuntu containers, there is a problem with the debian-add_ip.sh script
It assigns the 127.0.0.1 ip to all the interfaces (at least with venet)
It is a big source of problems, like snmp dying after some minutes (version 5.4.1 and avobe) and other misterious things that might happen.
In the forum someone posted a modified script that corrects the mistake.
http://forum.openvz.org/index.php?t=msg&th=817&start=0&

Could any devel have a look at it and push something like that int the trunk?
