Hi,

Can Someone please help me how to maintain a backup and restore the backup for the OPenvz installed VPS server and also to clients?

And also i am not able to install cpanel on it. getting below error message when installing cpanel
==========
Your operating system's rpm update method (yum) was not able to locate the
glibc package. This is an indication of an improper setup. You must
correct this error before you can proceed.
==========
The gilbc package is already installed.

rpm -qa glibc
glibc-2.3.4-2.25

With regards,
Dheeraj kumar.B
