Hello,

We have "iptables: Unknown error 4294967295" error on our vps when try to start installed firewall such as "APF"
How can resolve this issue?

Thanks

Hi,
Few days ago i had the same problem and i solved it.

You first, make sure that you have the right iptables value in hardware node config, as describes in this post:
http://kb.parallels.com/article_130_875_en.html

The problem is now, the --numiptent variable. You should increase to 1000. I try with less values, such as 300-500 and still with errors.
Then making:
vzctl set VE_ID --numiptent 1000 --save

The problem is absolutely solved. Apf now starts right.

I hope this help

Regards,
Victor Amil

Hi.

Victor, thank you for the update with the increased numiptent ubc value.
i've checked current APF version available (apf-9.6-5). With no additional configuration, just after simple start APF uses 329 ipt entries in my Container and if i set numiptent ubc parameter to 400 APF starts fine and no new failcounters appear.

But in any case 200 (as written in kb) is definitely not enough, we'll update the kb.

Thanks again!

i have same problem and i increase it to 400 and restarted apf but still getting

iptables: Unknown error 4294967295
iptables: Unknown error 4294967295
apf(21992): {glob} default (egress) output accept
apf(21992): {glob} default (ingress) input drop
iptables: Unknown error 4294967295
iptables: Unknown error 4294967295
iptables: Unknown error 4294967295
apf(21951): {glob} firewall initalized
apf(21951): {glob} fast load snapshot saved
root@xela [/]#

when i do a restart of the firewall.

I checked the version of the current APF (APF-9.6-5). No additional configuration, just after the start of a simple container with 329 armed police in my work IP phones, if the parameter is set numiptent UBC 400 APF I started fine, no new failcounters appear...
