Hi all

I know that my question is maybe a minour issue but i don't find clues to solve it. Few months ago i build new container, centos5 and i install vsftpd without troubles. But, since 1 or 2 months i have problems with ftp service.

Obviously, ftp service is running, and if i do

netstat -a

Proto Recv-Q Send-Q LocalAddress ForeignAddress State
tcp 0 0 *:ftp *:* LISTEN

So Ftp is listen! I don't have any messages on messages about this. Iptables is not installed in container and is off on Hnode. But Im confuse because first time i made ftp service all worked well. But i dont know what happened.

So, Any ideas?

Thank you!

Well, was not relationship with container :/ some trouble with PAM. I remove vsftpd and install proftpd.

bye
