Subject: IP issue and HN lag

Here we go.. Im running NH on Centos 5.1. When i create VE everything works great.. its running (it happens on all of my os templates i work with). So i decided to add one more IP address. I added it and here it starts:
After some time if i do not reboot VE right after i add an IP im unable to access my HOstNode (can ping and can traceroute but can not ssh to it), all VEs on this node are having huge packets loss about 90-95%.
What helps is: i kill init process of this VE only if i hook up monitor and a keyboard to the actual server, but i can not access it remotly. (but sometimes this method doesnt help and host node just gets stuck and the only way to fix it is: reboot).

kernel: 2.6.18-53.1.13.el5.028stab053.10PAE
OS: Centos 5.1

Any help would be grateful. Thanks.

I haven't encountered that before, as you sure that IP isn't being used on your lan already?

Nope ... New IP, newly added. never used before.
Im fighting with this issue for many months now.
