Subject: just loading vlan modules on HN , already causes network glitches

After i just load the vlan module 8021q on HN (or reboot
with this module in autoload),without actually creating any vlan
devices with vconfig, strange network glitches begin.
For example there are long delays to ssh to VE or other VEs are not reachable from VE.

I'm using 2.6.18.

Any ideas?

Hello,

Quote:
For example there are long delays to ssh to VE

Is there a chance to check a non OpenVZ kernel? (the kernel on which OpenVZ is based)

Quote:or other VEs are not reachable from VE.
Did you conduct any research investigations? tcpdump outputs or anything?
