Hi,

I have a question to the tutorial "Shared webhosting" part "Proxy webserver". In the last step is it necessary to add some lines for VirtualHost . But on which Server must I do that , on the Server where my Proxy runs or where my website runs ? My Root has the ip 217.117.xxx.xx(with a website) the vz with the proxy 192.168.172.49 and 192.168.172.50(with a website). At first I have add the lines in the /etc/lighttpd/lighttpd.conf on 192.168.172.49

```
$HTTP["host"] == "domain1.tl" {
  proxy.server  = ( "" => ( ( "host" => "217.117.xxx.xx" ) ) )
}

$HTTP["host"] == "domain2.tl" {
  proxy.server  = ( "" => ( ( "host" => "192.168.172.50(" ) ) )
}
```

, on 217.117.xxx.xx iptables -t nat -A PREROUTING -p TCP -d 217.117.xxx.xx --dport 80 $dnat 192.168.172.49:80.

Well, the next is to configure the VirtualHost in 192.168.172.50,

```
<VirtualHost 217.117.xxx.xx:80>
        ServerName domain2.tl
        RewriteEngine     On
        RewriteRule       ^(.*)$       http://192.168.172.50$1  [P]
        RewriteRule       ^(.*)$       http://www.domain2.tl$1   [P]
</VirtualHost>
```

, is that right ?

regards chris
