Subject: Using OpenVZ containers to control cpu for HN processes

Hi,

I'm not really wanting to setup virtual servers. I am simply wanting to control/limit process cpu allowances on a standard server (non virtual server).

The standard scheduling regimes in Linux fall short when it comes to controlling how much cpu % a process is given.

Can this be achieved with the openVZ kernel? Is there anyway I could run something like:

```
cpulimit PID 10%
```

(I don't want to use the cpulimit software as its not true cpu time sharing, it simply sends signals to turn processes on and off. I'm looking for a OpenVZ way of achieving the same thing).

So basically can I use openVZ containers to isolate a process and restrict its cpu usage - while still letting that process be able to access the HN filesystem - like a standard process on a standard server?

Any such response/help would be GREATLY appreciated.

Thanks

1) You can use kernel cpusets

<http://www.mjmwired.net/kernel/Documentation/cpusets.txt>

a tool that makes use of cpusets easy can be found here -

<http://developer.novell.com/wiki/index.php/Cpuset>

2) You can use the now default linux CFQ scheduler to schedule

based on control groups using the libcg - <http://libcg.sourceforge.net/>

The lxc containers project <http://lxc.sourceforge.net/> - is utilizing libcg and other recently included in mainline kernel

containerization parts. AFAIU this is the main contributor project whose container implementations are being included the mainline kernel.

Thank you very much for this information, really appreciate it.

Control groups looks like exactly what I'm wanting.

But I have done so much searching for any kind of guide on how to activate cgroups.

Am I correct in assuming its a kernel patch and needs to be added at compile time? Or can it be added as a module? Or is it already in the latest kernel?

How do I know if I have it and how do I set it up?

I have the latest kernel, how do I active cgroups?

Actually I think I just found out why I couldn't get it working.

I didn't select it during kernel compile time, woops

I am compiling a new kernel now, see how it goes.

Ok it is working now.

Thank you very much for pointing me in the right direction.
