Hi all,

On CentOS5 OS templates we're using vzdev-3.3.13-1.4.swsoft:

Now I'm somewhat wondering if it is affected by the vulnerability listed as CVE-2009-1185 or RHSA-2009:0427-01:

http://linuxcompatible.org/RHSA-20090427-01_Important_udev_security_update_p127899.html

<http://c-skills.blogspot.com/2009/04/udev-trickery-cve-2009-1185-and-cve.html>

The SRPM of vzdev isn't available, nor do I have yet managed to get my hands on the exploit code to test it against one of my CentOS5 VPS's.

Could you guys please take a look at this and if necessary release an updated vzdev?

Thanks!

- Michael Stauber

vzdev provides only udev capability.

It doesn't contain udev binary.

"rpm -ql vzdev"
