Hello, currently we have about 28 VPS's using Virtuozo that we want to move to our new HyperVM w/ OpenVZ node. We tried
http://www.smokinglinux.com/openvz-server-virtualization/how
-to-migrate-virtuozzo-vps-to-openvz

Using "vzlist -a" it reports there is no configuration file for in this case VPS 157, yet I know it is there(and I can vi/nano it).

Is there an easier way to migrate from Virtuozzo to OpenVZ.

Thanks,
Jacob

Since you are using Virtuozzo why don't you ask their support?
Since you (gonna) use HyperVM why don't you ask their support?

EDIT: I think I already found a way to move 'em.

If I tar the private/root and send them over, then manually create the configuration files I *SHOULD* hopefully be okay.
