Hi folks,

On creating ostemplate I encountered following error;

Disable sync() for syslog
http://wiki.openvz.org/Debian_template_creation#Disable_sync .28.29_for_syslog

sed -i -e 's@\([[:space:]]\)\(/var/log/\)@\1-\2@' /etc/syslog.conf
sed: can't read /etc/syslog.conf: No such file or directory

updatedb

locate syslog.conf
/etc/rsyslog.conf
/usr/share/man/man5/rsyslog.conf.5.gz
/var/lib/dpkg/info/rsyslog.conffiles

Please advise how to fix the problem. TIA

B.R.
satimis

Debian 5.0 can use rsyslog and thus rsyslog.conf rather than syslog.conf, but the format of the file remains the same AFAIK (still you'd better check it).

So just change /etc/syslog.conf to /etc/rsyslog.conf in sed cmdline. I have fixed the wiki accordingly.

Hi kir,

Thanks. Problem solved.
