Hello,

I'm trying to use the new features of openvz (veth...) but i
encounter problems... i have this kernel :

phoenix:~# uname -a
Linux phoenix 2.6.16-026test014 #1 Fri Jun 23 13:29:16 CEST 2006 i686
GNU/Linux

(compiled myself)

and version 3.0.10 of vzctl :

phoenix:~# vzctl --version
vzctl version 3.0.10

i run 2 PV'S :

phoenix:~# vzctl status 101
VPSID 101 exist mounted running
phoenix:~# vzctl status 102
VPSID 102 exist mounted running

when i try to add veth on a VPs i have this error :

phoenix:~# vzctl set 101 --veth_add
veth101.0,00:12:34:56:78:9A,eth0,00:12:34:56:78:9B --save
Processing veth devices
Warning: veth feature is not supported by kernel, skipped veth configure
Saved parameters for VPS 101

what can I do? Thank you!

- Rachid

If you compiled kernel yourself then check that you enabled
CONFIG_VE_ETHDEV option.
If you took binary kernel from openvz.org then check that you have
loaded the required kernel module:

modprobe vzethdev

Thanks,
Kirill

Oh tank you so much it works!!

How can I load this module automatically?

thanks

Hello,

/etc/modules.conf
or

/etc/modprobe.conf
depending on your distro.

Kirill
