The VPS provider has followed the following instructions but neither he or I have been able to create a tun device:

http://wiki.openvz.org/VPN_via_the_TUN/TAP_device

openvpn --mktun --dev tun0
Tue Aug 18 16:28:26 2009 Note: Cannot open TUN/TAP dev /dev/net/tun: Permission denied (errno=13)
Tue Aug 18 16:28:26 2009 Note: Attempting fallback to kernel 2.2 TUN/TAP interface
Tue Aug 18 16:28:26 2009 Cannot open TUN/TAP dev /dev/tun0: No such file or directory (errno=2)
Tue Aug 18 16:28:26 2009 Exiting

Thank you for looking!
