Subject: Apache guest logs VZ host IP instead of remote IP [INVALID]

Hi all.

I've installed apache2 under Debian in an OpenVZ guest -- the host is Gentoo. My problem is Apache logs only show OpenVZ host IP address in the remote host IP column -- hence I never know where my visitors come from. Is there something I can do to have the actual remote host IP address?

Thanks in advance for any hint/suggestion.

Kernel: sys-kernel/openvz-sources-2.6.18.028.053-r2
Tools: sys-cluster/vzctl-3.0.22

After further inspection, remote IP addresses are logged indeed. The VZ server IP address seems to be logged only when machines in the local network browse the site... Wierd still...
